The A chain is responsible for inhibiting protein synthesis through the catalytic inactivation of 60S ribosomal subunits. It acts as a glycosidase that removes a specific adenine residue from an exposed loop of 28S ribosomal factors, the modified ribosomes are unable to support protein synthesis. The A chain can inactivate a few thousand ribosomes per minute, thus inactivating them faster than the cell can make new ones. A single A-chain molecule can therefore kill an animal cell. The B chain binds to cell receptors and facilitates the entry into the cell of the A chain; B chains are also responsible for cell agglutination (Lectin activity). It binds to beta-D-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mutagenesis and X-ray crystallography.";

Eur. J. Biochem. 105:453-459(1980).
-i- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28s ran.
-i- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY. TYPE 2 RIP SUBFAMILY.
-i- SIMILARITY: Contains 2 ricin B-type lectin domains.

LEUR. J. Biochem. 198:723-732(1991).
C. -!- FROCTION: THE A CHAIN IS RESPONSIBLE FOR INHIBITING PROTEIN SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSOMAL SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 28 S RRNA. THE CHAIN IS A GALACTOSE-SPECIFIC LECTIN THAT FACILITATES THE BINDING OF ABRIN TO THE CELL MEMBRANE THAT PACELLITATES THE BINDING OF ABRIN TO THE CELL MEMBRANE THAT PRECEDES ENDOCYTOSIS.
C. -!- CATALYTIC ACTIVITY: Endobydrolysis of the N-glycosidic bond at one specific adenosine on the 28s rRNA.
C. -!- SUBUNIT: DISULFIDE-LINKED DIMER OF A AND B CHAINS.
C. -!- SUBUNIT: DISULFIDE-LINKED DIMER OF A AND B CHAINS.
C. -!- SUBUNIT: DISULFIDE-LINKED DIMER OF A BETA, GAMMA).
C. -!- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE RIBOSOME-
INACTIVATING PROTEIN FAMILY. TYPE 2 RIP SUBFAMILY.
C. -!- SIMILARITY: Contains 2 ricin B-type lectin domains.
                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        use by non-profit institutions we modified and this statement is not removed. with complete amino acid sequences of the B-chains of abrin-a and abrin-b, toxic proteins from the seeds of Abrus precatorius.";

Biosci. Biotechnol. Biochem. 57:166-169(1993).

-i- FUNCTION: THE A CHAIN IS REPONSIBLE FOR INHIBITING PROTEIN SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSOMAL SUBUNITS BY REMOVING ADENINE FROM POSITION 4,324 OF 28 S RRNA.

ABRIN-A IS MORE TOXIC THAN RICIN.

-i- FUNCTION: THE B CHAIN IS A GALACTOSE-SPECIFIC LECTIN THAT FACILITATES THE BINDING OF ABRIN TO THE CELL MEMBRANE THAT PRECEDES ENDOCYTOSIS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Q06077; P81374;

J. 309:285-298(1995).

-i- FUNCTION: TRICHOSANTHIN IS AN ABORTION-INDUCING PROTEIN. IT IS CAPABLE OF INHIBITING HIV-1 INFECTION AND REPLICATION. IT INACTIVATES EUKARYOTIC GOS RIBOSOMAL SUBUNITS.

-i- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28s rRNA.

-i- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.

FUNCTION: ABORTION-INDUCING PROTEIN. IT INACTIVATES EUKARYOTIC 60S RIBOSOMAL SUBUNITS.
CARALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at specific adenosine on the 28S rnna.
SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY
                                                                                                                                                                                                                                                                                                                   s SWISS-PROT entry is copyright.    PRODUCE A SHORTER PROTEIN.

BIOTECHNOLOGY: Especially useful as immunotoxin toxic
                                     PROTEIN SYNTHESIS IN ANIMAL CELLS.

CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.

PTM: APPEARS TO UNDERGO PROTEOLYTIC CLEAVAGE IN THE C-TERMINAL TO
                                                                                FUNCTION: RIBOSOME-INACTIVATING PROTEIN OF TYPE 1,

                                                       T "Complete mino acid sequence of the A chain of mistletoe lectin I.";

L FEBS Lett. 399:153-157(1996).

C --- FUNCTION: THE A CHAIN IS RESPONSIBLE FOR INHIBITING PROTEIN SYPWHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSOMAL SUBUNITS BY REMOVING ADENINE FROM POSITION 4,324 OF 28 S. RRNA. THE B CHAIN BINDS TO CELL RECEPTORS AND PROBABLY FACILITATES THE ENTRY C. INTO THE CELL OF THE A CHAIN, B CHAINS ARE ALSO RESPONSIBLE FOR C. CELL AGGLUTINATION (LECTIVA ACTIVITY).

C --- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28s rrna.

C --- SUBUNIT: Disulfide-linked dimer of A and B chains.

C --- SUBUNIT- Disulfide-linked dimer of A subunity and subunity and the studied in clinical trials in cancer patients as it may slow the growth of cancer cells and be an effective treatment for solid

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
